

Math 324 Winter 2018

Advanced Multivariable Calculus

Section A: MWF 8:30-9:20 am CHL 015

Instructor: Nikolas Eptaminitakis
Email: neptamin@uw.edu
Office Hours: TBA

Course description and prerequisites

The topics we will cover include Double and Triple Integrals, the Chain Rule, Directional Derivatives, Vector fields, Line and Surface integrals, the Grad, Curl and Div operators, the Divergence Theorem, and Green's and Stokes' Theorems. This course is a continuation of the 120 level calculus courses, and its content partly overlaps with material covered in Math 126. **Warning: The most challenging part of this class is towards the end, and the last few sections assume a good understanding of the entire material covered during the quarter.** Especially if you took Math 126 recently, you might find the first couple of weeks easy to follow, but this might not be the case later.

As for prerequisites, I will assume you are comfortable with basic differentiation and integration in one variable and basic algebraic manipulations. However, you shouldn't expect to have to deal with some really complicated integration tricks and I will be reviewing past material you might not remember whenever necessary.

Textbook/Study resources

I will generally be following the **textbook** "*Multivariable Calculus - Custom Edition (Early Transcendentals)*", 7th Edition by James Stewart. We will cover part of chapter 14 and all of Chapter 15. On the class website you can also find my **lecture notes**, which will be updated periodically.

If you need to contact me via email, you can use the address provided above. I will try to respond within 24 hours. You are also strongly encouraged to form study groups. It can help you learn in a more efficient manner and clear up misconceptions. Another resource you might want to consider is CLUE, the free late-night study center at Mary Gates Hall. You can find more information here:

<http://depts.washington.edu/aspuw/clue/home/>

Homework

There will be homework assigned roughly once a week, and it will be submitted and graded through **WebAssign**. You will need a WebAssign access code, but if you have already purchased a Lifetime of the Edition access to WebAssign for the 7th edition of Calculus: Early Transcendentals of Stewart in Math 124-6, it should still work for Math 324. **I will not give individual extensions to homework assignments.** To make up for that, at

the end I will add 10% to your homework average score, up to 100% (that is, 87% will count as 97% and 92% will count as 100%).

Exams

There will be a midterm and a final. They will take place in our regular classroom, on the following dates:

Exam	Date	Time
Midterm	Wednesday, February 7	8.30-9.20 am
Final Exam	Tuesday, March 13	8.30-10.20 am

Note that the final exam date and time are assigned by the university and **cannot be changed. To pass this class, you have to take the final exam.**

As per departmental policy, during all exams you will be allowed a **TI 30X IIS calculator** and **one sheet of hand-written notes** (8.5×11 inches, double sided).

No make-up midterm will be given. If you have a compelling, documented and unavoidable reason to miss the midterm, I will give you a grade based on the median of the midterm and your performance in the final: I will calculate how many standard deviations away from the median you scored on the final. Then, if the resulting number is x , your grade for the midterm you missed will be x standard deviations away from the median of the midterm. This formula will give a more fair result in case the level of difficulty in the two exams is not the same. **In any case, to be excused for an exam you need to inform me in advance.**

Quizzes

There will be quizzes on most Wednesdays at the end of class, 10-15' long (depending on each particular quiz). No makeup quizzes will be given, but your worst quiz grade will be dropped.

Mathematica tutorial

I will run a tutorial on Wolfram Mathematica, on a date and time to be announced soon. Mathematica is a powerful symbolic computation program that can be used for computation of integrals both symbolically and numerically, differentiation, visualization of curves and surfaces etc. We will see how to use some commands that are relevant to the course. Participation to the tutorial is completely optional, it does not count towards your grade, and you will not be tested on anything related to it. Mathematica is provided for free by UW College of Engineering to UW students, and you can find it by clicking on the following link:

<https://www.engr.washington.edu/mycoe/computing>.

Feel free to let me know if you have trouble installing it.

Grade Distribution

The grade distribution is as follows

Homework	15%
Quizzes	15%
Midterm	30%
Final Exam	40%

Also note that this is a curved class.

Academic misconduct

Cheating in exams is a serious offense and it will not be tolerated in this class. Details of the University policy on cheating can be found at

<http://depts.washington.edu/grading/pdf/AcademicResponsibility.pdf>.

Resources for Students with Disabilities

The University of Washington is committed to providing access, equal opportunity and reasonable accommodation in its services, programs, activities, education and employment for individuals with disabilities. To request disability accommodation contact the Disability Services Office at: 206-543-8924 or uwdrs@uw.edu .
