

1. (10 pts.) The two parts are not related.

(a) Use an integral to compute the volume of a ball of radius R in the xyz space.

Center at $(0,0,0)$. Use spherical coords

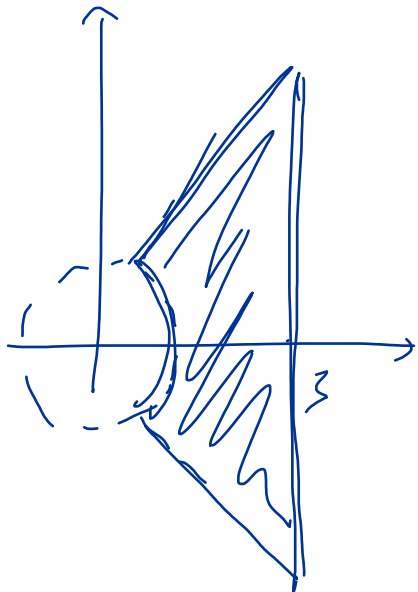

$$V = \int_0^{2\pi} \int_0^\pi \int_0^R \rho^2 \sin \varphi \, d\rho \, d\varphi \, d\theta =$$

$$= 2\pi \left. \frac{\rho^3}{3} \right|_0^R (-\cos \varphi) \Big|_0^\pi = 2\pi \cdot \frac{R^3}{3} \cdot 2 = \\ = \frac{4}{3} \pi R^3$$

2. (8 pts.) Suppose we have a lamina that lies on the subset

$$D = \{(x, y) : x^2 + y^2 \geq 1, |y| \leq \sqrt{3}x, x \leq 3\}$$

of the xy plane and has density function $\rho(x, y) = \frac{1}{x^2 + y^2}$. Find its moment about the y axis (the M_y)

$$-\sqrt{3}x \leq y \leq \sqrt{3}x$$

Write D in polar:

$$x^2 + y^2 \geq 1 \Rightarrow r \geq 1$$

$$|y| \leq \sqrt{3}x \Rightarrow$$

$$|r \sin \theta| \leq \sqrt{3} r \cos \theta$$

$$\Rightarrow |\tan \theta| \leq \sqrt{3}$$

$$\Rightarrow \theta \in \left[-\frac{\pi}{3}, \frac{\pi}{3}\right]$$

$$x \leq 3 \Rightarrow r \cos \theta \leq 3 \Rightarrow r \leq \frac{3}{\cos \theta}$$

$$\text{So } M_y = \iint_D x \rho(x, y) dA = \int_{-\frac{\pi}{3}}^{\frac{\pi}{3}} \int_1^{\frac{3}{\cos \theta}} \frac{3}{r \cos \theta} \frac{1}{r^2} r dr d\theta$$

$$= \int_{-\frac{\pi}{3}}^{\frac{\pi}{3}} \cos \theta \left(\frac{3}{\cos \theta} - 1 \right) d\theta =$$

$$= 3 \cdot \frac{2\pi}{3} - \int_{-\frac{\pi}{3}}^{\frac{\pi}{3}} \cos \theta = 2\pi - \sin \theta \Big|_{-\frac{\pi}{3}}^{\frac{\pi}{3}} = 2\pi - \left(\frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{2} \right) = 2\pi - \sqrt{3}$$

2. (10 pts.) Write down the equations used to change from Cartesian coordinates to Spherical coordinates (ρ, θ, ϕ) (that is, $x = x(\rho, \theta, \phi)$, $y = y(\rho, \theta, \phi)$ and $z = z(\rho, \theta, \phi)$) and then set up **but do not evaluate** the integral

$$\iiint_E yz dV$$

in **spherical coordinates**, where E is the set below:

E lies inside the sphere $x^2 + y^2 + z^2 = -6z$, under the half cone $z = -\sqrt{x^2 + y^2}$ and satisfies $y \leq 0$.

$$x = \rho \sin \phi \cos \theta$$

$$y = \rho \sin \phi \sin \theta$$

$$z = \rho \cos \phi$$

$$x^2 + y^2 + z^2 = -6z \Rightarrow \rho^2 = -6\rho \cos \phi \Rightarrow \rho = -6 \cos \phi$$

$$\text{So } 0 \leq \rho \leq -6 \cos \phi$$

$$y \leq 0 \Rightarrow \pi \leq \theta \leq 2\pi$$

$$z = -\sqrt{x^2 + y^2} \Rightarrow \rho \cos \phi = -\rho \sin \phi \Rightarrow \phi = \frac{3\pi}{4}$$

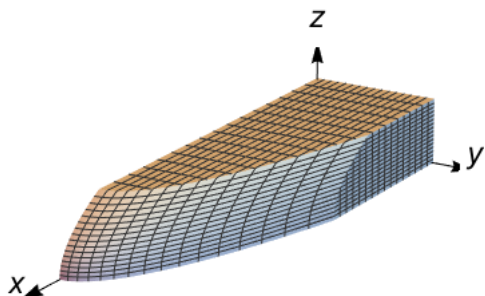

So

$$\iiint_E yz dV = \int_{\pi}^{2\pi} \int_{\frac{3\pi}{4}}^{\pi} \int_0^{-6 \cos \phi} (\rho \sin \phi \sin \theta) (\rho \cos \phi) \rho^2 \sin \phi d\rho d\phi d\theta$$

4. (12 pts.) Set up an integral of

$$\iiint_E f(x, y, z) dV$$

in the order $dydx dz$, where E is the solid satisfying $0 \leq x \leq 7 - y^2 - z^2$, $0 \leq z \leq 1$ and $0 \leq y \leq 2$ (the set E can be seen in the picture).

Equations, solve for y :

$$\textcircled{1} \quad x = 7 - y^2 - z^2 \Rightarrow y^2 = 7 - x - z^2$$

$$\Rightarrow y = \sqrt{7 - x - z^2}$$

$$\textcircled{2} \quad x = 0$$

$$\textcircled{3} \quad y = 0$$

$$\textcircled{4} \quad y = 2$$

$$\textcircled{5} \quad z = 0$$

$$\textcircled{6} \quad z = 1$$

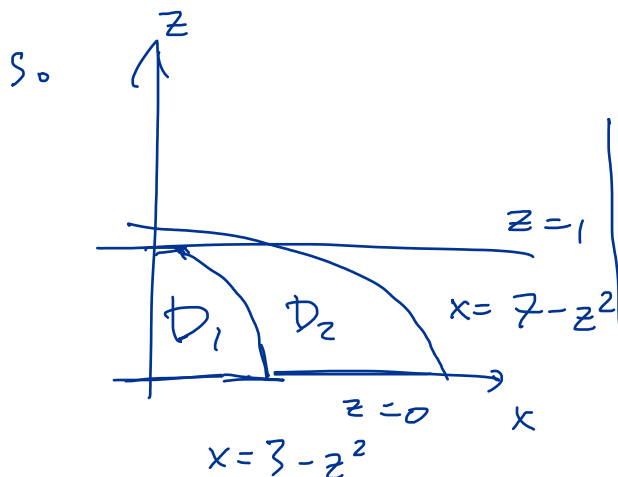

y appears 3 times \Rightarrow
sum of int's.

write projection on xz
plane:

$$\textcircled{1}, \textcircled{3} \Rightarrow 7 = x + z^2 \Rightarrow x = 7 - z^2$$

$$\textcircled{1}, \textcircled{4} \Rightarrow 2 = \sqrt{7 - x - z^2} \Rightarrow$$

$$x = 7 - z^2$$

$$\text{Over } D_1 = \{(x, z) : 0 \leq x \leq 3 - z^2, 0 \leq z \leq 1\}$$

$$\text{we have } 0 \leq y \leq 2$$

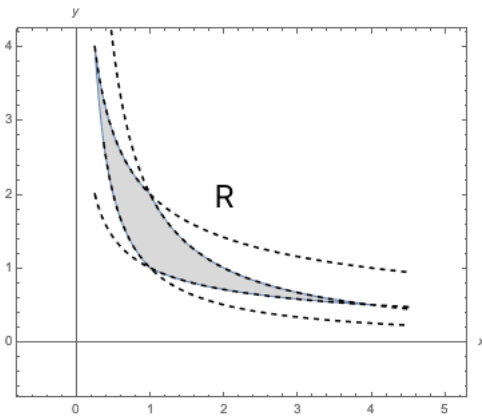

$$\text{Over } D_2 = \{(x, z) : 3 - z^2 \leq x \leq 7 - z^2, 0 \leq z \leq 1\}$$

$$0 \leq y \leq \sqrt{7 - x - z^2}$$

So:

$$\iiint_E f dV = \int_0^1 \int_0^{3-z^2} \int_0^2 f(x, y, z) dy dx dz + \int_0^1 \int_{3-z^2}^{7-z^2} \int_0^{\sqrt{7-x-z^2}} f(x, y, z) dy dx dz$$

5. (10 pts.) Use the change of variables $x = \frac{u^2}{v^2}$, $y = \frac{v^2}{u}$ defined on $\{(u, v) : u > 0, v > 0\}$, to evaluate $\iint_R 4xy^3 dA$, where R is the region in the first quadrant bounded by $y = \frac{1}{x}$, $y = \frac{2}{x}$, $y = \frac{1}{\sqrt{x}}$ and $y = \frac{2}{\sqrt{x}}$ (the domain R can be seen in the picture). You must show your work clearly, but you don't need to show that the transformation is invertible.

$$T: \quad x = \frac{u^2}{v^2}$$

$$y = \frac{v^2}{u}$$

Find $T^{-1}(R)$:

$$y = \frac{1}{x} \Rightarrow \frac{v^2}{u} = \frac{v^2}{u^2} \Rightarrow u = 1$$

$$y = \frac{2}{x} \Rightarrow \frac{v^2}{u} = \frac{v^2}{u^2} \cdot 2 \Rightarrow u = 2$$

$$y = \frac{1}{\sqrt{x}} \Rightarrow \sqrt{x} y = 1 \Rightarrow \frac{u}{v} \frac{v^2}{u} = 1 \Rightarrow v = 1$$

$$y = \frac{2}{\sqrt{x}} \Rightarrow v = 2$$

$$\text{so } T^{-1}(R) = [1, 2] \times [1, 2].$$

Jacobian:

$$\frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{2u}{v^2} & -2\frac{u^2}{v^3} \\ -\frac{v^2}{u^2} & \frac{2v}{u} \end{vmatrix} = \frac{4}{v} - 2\frac{1}{v} = \frac{2}{v} \neq 0$$

By theorem

$$\begin{aligned} \iint_R 4xy^3 dA &= \int_1^2 \int_1^2 4 \frac{u^2}{v^2} \frac{v^6}{u^3} \frac{2}{v} dv du = \\ &= 2 \int_1^2 \frac{1}{u} du \int_1^2 4v^3 dv = 2 \ln 2 (16 - 1) = 30 \ln 2 \end{aligned}$$
