Lesson 28 03/25/2022 If 4 periodic and on every Theorem: interval [a,b] it is piecewise smooth, then its F.S. piecewise cont. on [a,b] converges:
and f'is a) to f(t) if f is cont. b) to the average  $f(t^+) + f(t^-)$ if f is discontate. Piecewise contou [a,b] {(++) = lim f(s) s>++ Here: Observation: If f cont. at t then  $\lim_{s\to t^+} f(s) = \lim_{s\to t^-} f(s) = f(t)$  $\frac{f(t') + f(t')}{2} = \frac{f(t) + f(t)}{2} = f(t').$ 50: can say that F.S. converges to the average of side limits of fact t, regardless of whether f is cont. So:

 $\underline{\mathcal{E}_{\mathbf{X}}}: f(t) = t, \quad f \in [-\pi, \pi]$ interval of length 211 2n-periodic 371 511 -> piecewise supoth. Found F.S. for f:  $f \sim \frac{2(-1)^{n+1}}{2} \sin(n+1)$ For t= 0: f cont at o. Expect F.S. to converge to f(0) = 0.  $\frac{1}{8} = \frac{2(-1)}{8} = \frac{2(-1)}{8} = \frac{1}{8} = \frac{1}{1} = \frac{1}{1$ Plug in too.

At 
$$t=\pi$$
:  $f$  discont, here. Expect

the F.S. to converge to

$$\frac{f(\pi)+f(\pi^{1})}{2} = \frac{\pi}{2} + (-\pi) = 0$$

At  $t=\frac{\pi}{2}$ :  $f$  cont. at  $\frac{\pi}{2}$ ,  $f(\frac{\pi}{2})=\frac{\pi}{2}$ .

Expect F. S. to converge to

$$\frac{\pi}{2} = \frac{2(-1)^{n+1}}{n} = \frac{\sin(\frac{n\pi}{2})}{n}$$

Can help us compute the value of an infinite sum!

$$\frac{\sin(\frac{n\pi}{2})}{n} = \frac{\sin(\frac{n\pi}{2})}{n} = \frac{1}{n} = \frac{1}$$

## Ex 3:

3. (4 pts.) You are given the graph of a  $2\pi$ -periodic, piecewise smooth function f(t).

Since it is  $2\pi$  periodic and piecewise smooth, it has a Fourier series expansion of the form

$$f(t) \sim \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos(nt) + b_n \sin(nt)\right).$$
 Determine the value of the infinite sum

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} a_n (-1)^n.$$

Jobe:
$$Sin(\pi u) = 0$$

$$Cos(\pi u) = (-1)^n$$

$$So: \frac{ao}{2} + Sau(-1)^n = \frac{f(\pi^-) + f(\pi^+)}{2}$$

$$= \frac{1 + (-2)}{2} = -\frac{1}{2}$$
